

## Ferris Wheel (revisited)

A Ferris Wheel is 50 meters in diameter and rotates once every three minutes.

The center axle of the Ferris Wheel is 30 meters from the ground.

- Using the axes below, sketch a graph to show how the height of a passenger will vary with time. Assume that the wheel starts rotating when the passenger is at the bottom.

- A mathematical model for this motion is given by the formula:

$$h = a + b \cos ct$$

where

$h$  = the height of the car in meters

$t$  = the time that has elapsed in minutes

$a, b, c$  are constants.

Find values for  $a, b$  and  $c$  that will model this situation.
